

POCKETSMART AI • PHASE 1

Brainstorming & Ideation Phase

From everyday budgeting problems to a cross-domain AI assistant

PocketSmart AI: Your Smart Budget & Recommendation Assistant

Brainstorming & Ideation Phase

From everyday budgeting problems to a cross-domain AI assistant

1. Problem Identification

Managing budgets for home decor, event planning, and jewelry shopping can be difficult because users face many products, platforms, and price ranges. The project guide positions PocketSmart AI as a response to this challenge.

2. Core Idea

PocketSmart AI is conceived as a GenAI-powered, cross-platform recommendation system that combines a user's budget, preferences, and contextual needs to generate personalized recommendations.

3. Three Initial Use Scenarios

Scenario	How PocketSmart AI applies the idea
Home Interior Planning	Users provide a budget, room types, and quantities such as lights, ceiling fans, and dining tables. The system generates cost-aware options while considering functionality, style, and price.
Party Budget Planning	Users provide total budget, guest count, event type, and venue details. The AI allocates budget across areas such as catering, decoration, and entertainment and suggests relevant options.
Jewelry Recommendations	Users provide a budget, occasion, and style preferences. An outfit image can optionally be supplied so the AI can consider color coordination and aesthetics.

Phase Outcome

The ideation phase establishes a single assistant that can reuse the same budget-and-preference concept across multiple lifestyle planning domains.
