

POCKETSMART AI • PHASE 2

Requirement Analysis Phase

Defining users, inputs, outputs, and functional expectations

Requirement Analysis Phase

Defining users, inputs, outputs, and functional expectations

1. Functional Requirements

Area	Requirement	
['Home Planner', 'Budget, room details, quantities, preferences; return home/interior product suggestions.']	['Party Planner', 'Budget, guest count, event type, venue details; return food, venue, decoration and related options.']	['Jewelry Planner', 'Jewelry options.']

2. Planner-Specific Inputs

- The frontend must collect budgets, preferences, category information, and optional images where applicable.
- The backend must provide planner endpoints and connect the UI with the Gemini AI recommendation layer.
- The system should support platform-oriented recommendations involving sources such as Amazon, Flipkart, IKEA, Swiggy, Zomato, and OYO.

3. Recommendation Requirements

- Testing requirements include budget adherence, recommendation quality, platform accuracy, input validation, and fallback/default recommendations.

4. User & Session Requirements

Authentication and session features are documented through registration, login, logout, JWT token access, session metadata, and session-specific data.

Phase Outcome

The requirements phase converts the project idea into concrete input, processing, output, authentication, history, and validation expectations.
