

POCKETSMART AI • PHASE 5

Project Development Phase

Implementing the AI, backend services, authentication, and frontend

Project Development Phase

Implementing the AI, backend services, authentication, and frontend

1. Gemini AI Integration

The guide describes configuring Gemini 1.5 Flash Pro, creating API access, validating connectivity, and testing both text-only and image-plus-text prompts.

2. Core Backend Development

Backend & AI

- Implement planner endpoints for Home, Party, and Jewelry.
- Use recommendation logic to interpret budgets and generate domain-specific results.
- Support optional image analysis for jewelry recommendations.
- Use modular structures for routes, services, and models.

Authentication & Personalization

- Registration and login handle user credentials.
- Logout terminates the current session.
- JWT token issuance supports authorized access to protected routes.
- Session information and session-specific data support personalization and recommendation tracking.

Frontend

- Create category/planner forms for Home, Party, and Jewelry.
- Display AI responses in structured card-like layouts with product details and prices.
- Use Jinja2 templates and connect forms to FastAPI POST routes.

3. Authentication & Session Features

Documented routes include /register, /login, /logout, /token, /session-info, and /session-data.

4. Frontend Implementation

The guide documents planner forms, dynamic result displays, authentication pages, and card-like recommendation layouts using HTML/CSS/Jinja2 with FastAPI integration.

Phase Outcome

Development turns the architecture into a working full-stack flow: user input → backend route → Gemini processing → recommendation response → UI display.
