

POCKETSMART AI • PHASE 6

Project Testing Phase

Validating reliability, accuracy, budget adherence, and user flows

PocketSmart AI: Your Smart Budget & Recommendation Assistant

Project Testing Phase

Validating reliability, accuracy, budget adherence, and user flows

1. Testing Scope

The guide specifies testing with real-world use cases across Home Interiors, Party Planning, and Jewelry Suggestions.

2. Test Dimensions

Test area	Example validation focus
Home	Use varied budgets and preferences for home decor setups involving sources such as IKEA and Amazon.
Party	Test party packages involving food, venues, and decoration, including sources such as Swiggy, Zomato, and OYO.
Jewelry	Test occasion/style inputs and optional outfit images for matching jewelry suggestions.
AI Quality	Evaluate Gemini response quality and contextual relevance.
Budget	Check whether recommendations follow the user's stated budget.
Platform Accuracy	Evaluate whether recommendations are aligned with the intended platform/source.
UI/UX	Check smooth interaction and responsiveness across devices.

3. Optimization Activities

- Refine AI prompt structures.
- Add input validations to prevent edge-case failures.
- Improve session handling.
- Provide fallback/default recommendations when AI results are insufficient.

4. Fallback & Edge-Case Handling

The guide explicitly calls for validations to prevent input edge-case failures and fallback/default recommendations when the AI returns insufficient results.

Phase Outcome

Testing is not limited to code correctness; it checks whether the recommendation experience remains useful, budget-aware, contextual, and stable across the three planners.
